5 TITLE OF THE INVENTION  
PROSTAGLANDIN RECEPTOR LIGANDS

BACKGROUND OF THE INVENTION

10 This invention relates to compounds and methods for treating prostaglandin mediated diseases, and certain pharmaceutical compositions thereof. More particularly, the compounds of the invention are structurally different from NSAIDs and opiates, and are antagonists of the pain and inflammatory effects of E-type prostaglandins.

15 Two review articles describe the characterization and therapeutic relevance of the prostanoid receptors as well as the most commonly used selective agonists and antagonists: *Eicosanoids: From Biotechnology to Therapeutic Applications*, Folco, Samuelsson, Macclouf, and Velo eds, Plenum Press, New York, 1996, chap. 14, 137-154 and Journal of Lipid Mediators and Cell Signalling, 1996, 14, 83-87. An  
20 article from *The British Journal of Pharmacology* (1994, 112, 735-740) suggests that Prostaglandin E<sub>2</sub> (PGE<sub>2</sub>) exerts allodynia through the EP<sub>1</sub> receptor subtype and hyperalgesia through EP<sub>2</sub> and EP<sub>3</sub> receptors in the mouse spinal cord.

25 Thus, selective prostaglandin ligands, agonists or antagonists, depending on which prostaglandin E receptor subtype is being considered, have anti-inflammatory, antipyretic and analgesic properties similar to a conventional non-steroidal anti-inflammatory drug, and in addition, inhibit hormone-induced uterine contractions and have anti-cancer effects. These compounds have a diminished  
30 ability to induce some of the mechanism-based side effects of NSAIDs which are indiscriminate cyclooxygenase inhibitors. In particular, the compounds have a reduced potential for gastrointestinal toxicity, a reduced potential for renal side effects, a reduced effect on bleeding times and a lessened ability to induce asthma attacks in aspirin-  
35 sensitive asthmatic subjects.

PCT application nos WO 96/06822 (March 7, 1996), WO 96/11902 (April 25, 1996), WO 97/00863 (January 9, 1997), WO 97/00864 (January 9, 1997), WO 96/03380 (February 8, 1996), and EP 752421-A1 (January 08, 1997) disclose compounds represented by Formula I as  
40 being useful in the treatment of prostaglandin mediated diseases.

Optical Isomers - Diastereomers - Geometric Isomers

Some of the compounds described herein contain one or more asymmetric centers and may thus give rise to diastereomers and

- 5 optical isomers. The present invention is meant to comprehend such possible diastereomers as well as their racemic and resolved, enantiomerically pure forms and pharmaceutically acceptable salts thereof.

- 10 Some of the compounds described herein contain olefinic double bonds, and unless specified otherwise, are meant to include both E and Z geometric isomers.

#### Salts

- The term "pharmaceutically acceptable salts" refers to salts prepared from pharmaceutically acceptable non-toxic bases including inorganic bases and organic bases. Salts derived from inorganic bases include aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic, manganous, potassium, sodium, zinc salts, and the like. Particularly preferred are the ammonium, calcium, magnesium, potassium, and sodium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include salts of primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines, and basic ion exchange resins, such as arginine, betaine, caffeine, choline, N,N'-dibenzylethylenediamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethylpiperidine, glucamine, glucosamine, histidine, hydrabamine, isopropylamine, lysine, methylglucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethylamine, trimethylamine, tripropylamine, tromethamine, and the like.

- When the compound of the present invention is basic, salts may be prepared from pharmaceutically acceptable non-toxic acids, including inorganic and organic acids. Such acids include acetic, benzenesulfonic, benzoic, camphorsulfonic, citric, ethanesulfonic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, pantoic, pantothenic, phosphoric, succinic, sulfuric, tartaric, p-toluenesulfonic acid, and the like. Particularly preferred are citric, hydrobromic, hydrochloric, maleic, phosphoric, sulfuric, and tartaric acids.

5           It will be understood that in the discussion of methods of  
treatment which follows, references to the compounds of Formula II are  
meant to also include the pharmaceutically acceptable salts and  
hydrates.

10   Dose Ranges

          The magnitude of a prophylactic or therapeutic dose of a  
compound of Formula II will, of course, vary with the nature and the  
severity of the condition to be treated and with the particular compound  
of Formula II and its route of administration. It will also vary  
15 according to a variety of factors including the age, weight, general  
health, sex, diet, time of administration, rate of excretion, drug  
combination and response of the individual patient. In general, the  
daily dose from about 0.001 mg to about 100 mg per kg body weight of a  
mammal, preferably 0.01 mg to about 10 mg per kg. On the other hand,  
20 it may be necessary to use dosages outside these limits in some cases.

          The active ingredient that may be combined with the carrier  
materials to produce a single dosage form will vary depending upon the  
host treated and the particular mode of administration. For example, a  
formulation intended for oral administration to humans may contain  
25 from as low as about 0.5 mg to as high as about 5 g of active agent,  
compounded with an appropriate and convenient amount of carrier  
material which may vary from about 5 to about 95 percent of the total  
composition. Dosage units will generally contain between from about 1  
mg to about 2 g of the active ingredient, typically 25 mg, 50 mg, 100 mg,  
30 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

Pharmaceutical Compositions

          The pharmaceutical compositions of the present invention  
comprise a compound of Formula II as an active ingredient or a  
35 pharmaceutically acceptable salt or hydrate, thereof, and may also  
contain a pharmaceutically acceptable carrier and optionally other  
therapeutic ingredients.

          For the treatment of any of the prostanoid mediated diseases  
compound II may be administered orally, topically, parenterally, by  
40 inhalation spray or rectally in dosage unit formulations containing  
conventional non-toxic pharmaceutically acceptable carriers, adjuvants

5 and vehicles. The term parenteral as used herein includes  
subcutaneous injections, intravenous, intramuscular, intrasternal  
injection or infusion techniques. In addition to the treatment of warm-  
blooded animals such as mice, rats, horses, cattle, sheep, dogs, cats,  
etc., the compound of the invention is effective in the treatment of  
10 humans.

The pharmaceutical compositions containing the active  
ingredient may be in a form suitable for oral use, for example, as tablets,  
troches, lozenges, aqueous or oily suspensions, dispersible powders or  
granules, emulsions, hard or soft capsules, or syrups or elixirs.  
15 Compositions intended for oral use may be prepared according to any  
method known to the art for the manufacture of pharmaceutical  
compositions and such compositions may contain one or more agents  
selected from the group consisting of sweetening agents, flavouring  
agents, colouring agents and preserving agents in order to provide  
20 pharmaceutically elegant and palatable preparations. Tablets contain  
the active ingredient in admixture with non-toxic pharmaceutically  
acceptable excipients which are suitable for the manufacture of tablets.  
These excipients may be for example, inert diluents, such as calcium  
carbonate, sodium carbonate, lactose, calcium phosphate or sodium  
25 phosphate; granulating and disintegrating agents, for example, corn  
starch, or alginic acid; binding agents, for example starch, gelatin or  
acacia, and lubricating agents, for example, magnesium stearate,  
stearic acid or talc. The tablets may be uncoated or they may be coated by  
known techniques to delay disintegration and absorption in the  
30 gastrointestinal tract and thereby provide a sustained action over a  
longer period. For example, a time delay material such as glyceryl  
monostearate or glyceryl distearate may be employed. They may also be  
coated by the technique described in the U.S. Patent 4,256,108; 4,166,452;  
and 4,265,874 to form osmotic therapeutic tablets for control release.  
35 Formulations for oral use may also be presented as hard  
gelatin capsules wherein the active ingredient is mixed with an inert  
solid diluent, for example, calcium carbonate, calcium phosphate or  
kaolin, or as soft gelatin capsules wherein the active ingredients is  
mixed with water-miscible solvents such as propylene glycol, PEGs and  
40 ethanol, or an oil medium, for example peanut oil, liquid paraffin, or  
olive oil.

5           Aqueous suspensions contain the active material in  
admixture with excipients suitable for the manufacture of aqueous  
suspensions. Such excipients are suspending agents, for example  
sodium carboxymethylcellulose, methylcellulose, hydroxypropyl  
methylcellulose, sodium alginate, polyvinylpyrrolidone, gum tragacanth  
10 and gum acacia; dispersing or wetting agents may be a naturally-  
occurring phosphatide, for example lecithin, or condensation products  
of an alkylene oxide with fatty acids, for example polyoxyethylene  
stearate, or condensation products of ethylene oxide with long chain  
aliphatic alcohols, for example heptadecaethyleneoxycetanol, or  
15 condensation products of ethylene oxide with partial esters derived from  
fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or  
condensation products of ethylene oxide with partial esters derived from  
fatty acids and hexitol anhydrides, for example polyethylene sorbitan  
monooleate. The aqueous suspensions may also contain one or more  
20 preservatives, for example ethyl, or n-propyl, p-hydroxybenzoate, one or  
more colouring agents, one or more flavouring agents, and one or more  
sweetening agents, such as sucrose, saccharin or aspartame.

Oily suspensions may be formulated by suspending the  
active ingredient in a vegetable oil, for example arachis oil, olive oil,  
25 sesame oil or coconut oil, or in mineral oil such as liquid paraffin. The  
oily suspensions may contain a thickening agent, for example beeswax,  
hard paraffin or cetyl alcohol. Sweetening agents such as those set forth  
above, and flavouring agents may be added to provide a palatable oral  
preparation. These compositions may be preserved by the addition of an  
30 anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation  
of an aqueous suspension by the addition of water provide the active  
ingredient in admixture with a dispersing or wetting agent, suspending  
agent and one or more preservatives. Suitable dispersing or wetting  
35 agents and suspending agents are exemplified by those already  
mentioned above. Additional excipients, for example sweetening,  
flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also  
be in the form of an oil-in-water emulsion. The oily phase may be a  
40 vegetable oil, for example olive oil or arachis oil, or a mineral oil, for  
example liquid paraffin or mixtures of these. Suitable emulsifying

50103564-100798

- 5 agents may be naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain  
10 sweetening and flavouring agents.

- Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative and flavouring and colouring agents. The pharmaceutical compositions  
15 may be in the form of a sterile injectable aqueous or oleagenous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a  
20 non-toxic parenterally-acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution and isotonic sodium chloride solution. Cosolvents such as ethanol, propylene glycol or polyethylene glycols may also be used. In addition, sterile, fixed oils are  
25 conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

- Compound II may also be administered in the form of  
30 suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ambient temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols.

- 35 For topical use, creams, ointments, gels, solutions or suspensions, etc., containing the compound of Formula II are employed. (For purposes of this application, topical application shall include mouth washes and gargles.) Topical formulations may generally be comprised of a pharmaceutical carrier, cosolvent,

15   Utilities

          The ability of the compounds of Formula II to interact with prostaglandin receptors makes them useful for preventing or reversing undesirable symptoms caused by prostaglandins in a mammalian, especially human, subject. This mimicking or antagonism of the  
20 actions of prostaglandins indicates that the compounds and pharmaceutical compositions thereof are useful to treat, prevent, or ameliorate in mammals and especially in humans: Pain, fever and inflammation of a variety of conditions including rheumatic fever, symptoms associated with influenza or other viral infections, common

Further, a method of treating or preventing an E type  
10 prostaglandin mediated disease in a mammalian patient is described herein, comprising administering to said patient an amount of an E type prostaglandin ligand in an amount which is effective to treat or prevent said E type prostaglandin mediated disease.

More particularly, the method described with respect to E-  
15 typ prostaglandin mediated diseases further comprises administering a COX-2 selective inhibitor.

20 WO98/03484, WO97/14691 and WO95/00501.

#### METHODS OF SYNTHESIS

Compounds of the present invention can be prepared according to the following methods. Methods A, I and J showed how to  
25 form the linker W between Ar<sup>1</sup> and Ar<sup>2</sup>; methods B and E - H concentrate on linker X; method C explained how to obtain sulfonamides and method D illustrate how to substitute Ar<sup>1</sup>. One particular method is usually used in conjunction with other methods to yield compounds of formula II. Reagents given below are for illustration of the chemistry only and  
30 should not be limiting this patent: other reagents might be as effective or better for each reaction described.

#### Method A

An aryl alkene I can be coupled with an aryl bromide,  
35 iodide or triflate II in the presence of a catalyst such as Pd(OAc)<sub>2</sub> to give the two isomers III and IV. Catalytic hydrogenation of the double bond, using Pd/C or (Ph<sub>3</sub>P)<sub>3</sub>RhCl, yield the compound VI. Alternatively, VI can be prepared from I via formation of the boronate V with 9-borabicyclo[3.3.1]nonane and coupling with II in the presence of a  
40 catalyst such as PdCl<sub>2</sub>(dppf). Cyclopropanation of the alkenes III and IV can be performed using conditions such as CH<sub>2</sub>N<sub>2</sub>/PdOAc<sub>2</sub> to give VII and VIII. The group X-Q in compounds III, IV, VI, VII and VIII can

- 5 then be transformed to another X-Q group to afford other substructures of II.

#### Method B

- 10 The acid or esters IX can be reduced to the alcohol X using reagents such as diisobutylaluminum hydride or sodium borohydride. Oxidation to the aldehyde XI can be performed using  $\text{MnO}_2$  or pyridinium chlorochromate. Wittig reaction on XI afford the propenoate XII which can be cyclopropanated ( $\text{CH}_2\text{N}_2/\text{Pd}(\text{OAc})_2$ ) to XIII or reduced
- 15 ( $\text{H}_2/\text{Pd/C}$ ) to XIV. When R = H, compounds IX, XII, XIII and XIV are substructures of II.

5

Method C

The acid XV, which is a substructure of II, can be transformed to the sulfonamide XVI, another substructure of II, by treatment with a sulfonamide in the presence of a coupling reagent such as 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide. Another method for the preparation of XVI involves the formation of an acid chloride or a mixed anhydride XVII and reaction with the sulfonamide in the presence of a base such as Et<sub>3</sub>N.

10

15

Method D

When compound II or its precursor is substituted by an hydroxyl group as in XVIII, it can be alkylated by a reagent containing a

- 5 leaving group XIX in the presence of a base such as NaH or DBU to yield the ether XX. Alternatively, Mitsunobu reaction with the alcohol derivative of XIX also yield XX. The group X-Q in XX can then be transformed to another X-Q group to afford another example of II.

10

#### Method E

- 15 The aryl bromide, iodide or triflate XXI can be coupled with an alkyne or the alkene XXIII in the presence of a catalyst such as Pd(OAc)<sub>2</sub> (J. Org. Chem. 1979, 4078) to give the products XXII or XXIV respectively. Catalytic hydrogenation of the alkyne XXII over Lindlar's catalyst can afford the cis alkene XXV. When R = H, compounds XXII, XXIV and XXV are substructures of II and they can be treated as in method B to yield other examples of II.

20

#### Method F

- 25 An aryl thiol, alcohol or amine XXVI can be treated with a base and then with reagent XXVII to yield the derivative XXVIII. The

- 5 group E'-F-Q can be transformed to another E'-F-Q group using the other methods described here and yield examples of II possessing an heteroatom attached to Ar<sup>2</sup> in the linker X.

E = OH, SH, NHR<sup>11</sup>

F is a part of X  
(Q) is Q or its precursor

10

#### Method G

Compounds II possessing a cyclopropane unit as an X group XXX can be synthesized via a reaction between the alkene XXIX and a diazoacetate in the presence of a catalyst such as rhodium acetate dimer.

#### Method H

- 20 Compounds II possessing a double bond as part of the linker X can be synthesized via a Wittig reaction as exemplified in the next scheme. Phosphonium salts XXXII and XXXIV can be obtained from the corresponding Ar-CHR<sup>9</sup>-LG by reaction with Ph<sub>3</sub>P.

25

5 Method I

Compounds II possessing two heteroatoms as part of the linker W as in XL can be synthesized from a reagent containing two leaving groups XXXVII and two aromatics compounds containing an alcohol, an amine or a thiol function E as described in the following

10 scheme.

Method J

Compounds II possessing one heteroatom as part of the linker W as in XLV can be synthesized from a reagent containing one leaving group XLII or XLIII and an aromatic compound containing an alcohol, an amine or a thiol function E (XLI or XLIV) as described in the following two equations.

ASSAYS FOR DETERMINING BIOLOGICAL ACTIVITY

The compound of Formula II can be tested using the following assays to determine their prostanoïd antagonist or agonist

25 activity *in vitro* and *in vivo* and their selectivity. The prostaglandin receptors investigated were DP, EP<sub>1</sub>, EP<sub>2</sub>, EP<sub>3</sub>, EP<sub>4</sub>, FP, IP and TP.

5 Stable expression of prostanoid receptors in the human embryonic kidney (HEK) 293(ebna) cell line

Prostanoid receptor cDNAs corresponding to full length coding sequences were subcloned into the appropriate sites of mammalian expression vectors and transfected into HEK 293(ebna) cells. HEK 293(ebna) cells expressing the individual cDNAs were grown under selection and individual colonies were isolated after 2-3 weeks of growth using the cloning ring method and subsequently expanded into clonal cell lines.

15 Prostanoid receptor binding assays

HEK 293(ebna) cells are maintained in culture, harvested and membranes are prepared by differential centrifugation, following lysis of the cells in the presence of protease inhibitors, for use in receptor binding assays. Prostanoid receptor binding assays are performed in 10 mM MES/KOH (pH 6.0) (EPs, FP and TP) or 10 mM HEPES/KOH (pH 7.4) (DP and IP), containing 1 mM EDTA, 10 mM divalent cation and the appropriate radioligand. The reaction is initiated by addition of membrane protein. Ligands are added in dimethylsulfoxide which is kept constant at 1 % (v/v) in all incubations. Non-specific binding is determined in the presence of 1  $\mu$ M of the corresponding non-radioactive prostanoid. Incubations are conducted for 60 min at room temperature or 30 °C and terminated by rapid filtration. Specific binding is calculated by subtracting non specific binding from total binding. The residual specific binding at each ligand concentration is calculated and expressed as a function of ligand concentration in order to construct sigmoidal concentration-response curves for determination of ligand affinity.

Prostanoid receptor agonist and antagonist assays

Whole cell second messenger assays measuring stimulation (EP<sub>2</sub>, EP<sub>4</sub>, DP and IP in HEK 293(ebna) cells) or inhibition (EP<sub>3</sub> in human erythroleukemia (HEL) cells) of intracellular cAMP accumulation or mobilization of intracellular calcium (EP<sub>1</sub>, FP and TP in HEK 293(ebna) cells stably transfected with apo-aequorin) are performed to determine whether receptor ligands are agonists or antagonists. For cAMP assays, cells are harvested and resuspended in

- 5 HBSS containing 25 mM HEPES, pH 7.4. Incubations contain 100  $\mu$ M RO-20174 (phosphodiesterase type IV inhibitor, available from Biomol) and, in the case of the EP<sub>3</sub> inhibition assay only, 15  $\mu$ M forskolin to stimulate cAMP production. Samples are incubated at 37°C for 10 min, the reaction is terminated and cAMP levels are then measured. For
- 10 calcium mobilization assays, cells are charged with the co-factors reduced glutathione and coelenterazine, harvested and resuspended in Ham's F12 medium. Calcium mobilization is measured by monitoring luminescence provoked by calcium binding to the intracellular photoprotein aequorin. Ligands are added in dimethylsulfoxide which is
- 15 kept constant at 1 % (v/v) in all incubations. For agonists, second messenger responses are expressed as a function of ligand concentration and both EC<sub>50</sub> values and the maximum response as compared to a prostanoid standard are calculated. For antagonists, the ability of a ligand to inhibit an agonist response is determined by Schild
- 20 analysis and both K<sub>b</sub> and slope values are calculated.

#### Rat Paw Edema Assay

#### LPS-Induced Pyrexia in Conscious Rats

The method is the same as described in Boyce *et al* (Neuropharmacology 33: 1609-1611, (1994)).

#### Adjuvant-Induced Arthritis in Rats

Female Lewis rats (body weight ~146-170 g) were weighed, ear marked, and assigned to groups (a negative control group in which arthritis was not induced, a vehicle control group, a positive control group administered indomethacin at a total daily dose of 1 mg/kg and four groups administered with a test compound at total daily doses of

5 0.10-3.0 mg/kg) such that the body weights were equivalent within each group. Six groups of 10 rats each were injected into a hind paw with 0.5 mg of *Mycobacterium butyricum* in 0.1 mL of light mineral oil (adjuvant), and a negative control group of 10 rats was not injected with adjuvant. Body weights, contralateral paw volumes (determined by  
10 mercury displacement plethysmography) and lateral radiographs (obtained under Ketamine and Xylazine anesthesia) were determined before (day -1) and 21 days following adjuvant injection, and primary paw volumes were determined before (day -1) and on days 4 and 21 following adjuvant injection. The rats were anesthetized with an  
15 intramuscular injection of 0.03 - 0.1 mL of a combination of Ketamine (87 mg/kg) and Xylazine (13 mg/kg) for radiographs and injection of adjuvant. The radiographs were made of both hind paws on day 0 and day 21 using the Faxitron (45 kVp, 30 seconds) and Kodak X-OMAT TL film, and were developed in an automatic processor. Radiographs were  
20 evaluated for changes in the soft and hard tissues by an investigator who was blinded to experimental treatment. The following radiographic changes were graded numerically according to severity: increased soft issue volume (0-4), narrowing or widening of joint spaces (0-5) subchondral erosion (0-3), periosteal reaction (0-4), osteolysis (0-4)  
25 subluxation (0-3), and degenerative joint changes (0-3). Specific criteria were used to establish the numerical grade of severity for each radiographic change. The maximum possible score per foot was 26. A test compound at total daily doses of 0.1, 0.3, 1, and 3 mg/kg/day, indomethacin at a total daily dose of 1 mg/kg/day, or vehicle (0.5%  
30 methocel in sterile water) were administered per os b.i.d. beginning post injection of adjuvant and continuing for 21 days. The compounds were prepared weekly, refrigerated in the dark until used, and vortex mixed immediately prior to administration.

40 mmol) in 50 ml acetone was added 1,3-dibromopropane (1.50 ml; 14.8 mmol) and  $\text{K}_2\text{CO}_3$  (4.36 g; 13.4 mmol). The mixture was heated to reflux

- 5 for 12h, cooled to r.t, diluted with hexane (50 ml), filtered and finally concentrated to afford the title product (1.96 g; 50% pure), which was used as such in the next step.

#### Step 2

- 10 2-Benzyloxyphenol (obtained from catechol, NaH, and benzyl bromide as in examples 6 and 7, step 1) was treated with NaH and the product of step 1 as in examples 6 and 7, step 1 to afford the ester of the title product. This ester was hydrolyzed as in example 61, step 3 to yield the acid. The sodium salt was prepared as in examples 6 and 7,  
15 step 3.

MS (APCI, neg.) 403.1 (M-1), 233.1, 207.1.

#### EXAMPLE 75

- 20 SODIUM (E)-3-(2-((E)-3-(2-(1-PHENYLETHOXY)-3-METHYLPHENYL)-2-PROPENYL)PHENYL)-2-PROPENOATE

- 1-Phenylethanol was obtained by reduction of acetophenone with NaBH<sub>4</sub> in THF:MeOH. It was then reacted with the ester of example 61, step 1, via a Mitsunobu reaction (DIAD, Ph<sub>3</sub>P, THF:CH<sub>2</sub>Cl<sub>2</sub>, Synth. Commun. 1994, 24, 1049), to yield the ester of the title compound.  
25 This ester was hydrolyzed as in example 61, step 3, to give the title acid.

- The sodium salt was prepared as in examples 6 and 7, step 3.

MS (APCI, neg.) 397.1 (M-1), 293.0, 275.3, 233.2.

- 30 EXAMPLES 77 AND 78

SODIUM (E)-3-(2-((E)-3-(3-PHENOXYPHENYL)-1-PROPENYL)PHENYL)-2-PROPENOATE AND SODIUM (E)-3-(2-((E)-3-(3-PHENOXYPHENYL)-2-PROPENYL)PHENYL)-2-PROPENOATE

- 35 Step 1 1-bromo-3-phenoxybenzene

- To a solution of phenol (5.08g; 54mmol) in 30 ml dry DMF at 0°C was added portionwise NaH (1.98 g; 66 mmol; 80% dispersion in oil). The mixture was stirred 30 min at r.t. then 1,3-dibromobenzene (33 ml; 273 mmol) and Cu<sub>2</sub>O (3.95 g; 28 mmol) were added. The final mixture  
40 was heated to reflux for 4h, cooled to r.t., diluted with Et<sub>2</sub>O (200 ml), washed with water (3 x 200 ml), NaOH (1.0 M; 2 x 100 ml) and brine,

5 Step 2 3-phenylbenzofuran-7-yl-bromide

A mixture of 2-(2-bromophenoxy)-1-phenyl-1-ethanone (6.31 g) and polyphosphoric acid (285 g) was stirred at 95°C for 6 h. The resulting solution was cooled to 50°C, poured in water (2 L), extracted with Et<sub>2</sub>O (2 x 1 L). The combined organic extracts were washed with water (4 x 500 ml) and brine, dried over MgSO<sub>4</sub> and concentrated. The residual solid was filtered on a plug of silica gel using Et<sub>2</sub>O.

Recrystallization in hot hexane yielded the title compound (4.63g; 78%).

Step 3

Using the procedure of examples 77 and 78, steps 2 and 3, the bromide of step 2 was transformed to the title acid. The sodium salts were prepared as in examples 6 and 7, step 3.

MS (APCI, neg.) 379.4 (M-1), 335.1.
